

# Version 3.0 of E-Term32 Now Shipping!

## Upgrade Today!

All DCSi maintenance program customers will receive this upgrade release automatically. Upgrades from previous versions of our terminal emulation software are available for purchase.

The primary focus of the Version 3.0 is **SECURITY**. We have added **SSH support** for secure host sessions in this new release. SSH is a security protocol that resides on top of TCP/IP connections. SSH authenticates and encrypts your connection to UNIX, Linux and OpenVMS systems. With standard telnet connections all data to and from your PC travels in clear text (even user names and passwords). SSH creates a secure tunnel for your terminal and FTP session data. This eliminates the potential for eavesdropping or intrusion.

## Version 3.0 New Features

- ✓ SSH 1.5 - 2.0 Support
- ✓ New Custom TrueType Font
- ✓ Startup.Ini Editor
- ✓ Controller Mode Printing using Windows Print Drivers
- ✓ Updated WS\_FTP ® Pro Release
- ✓ And more general enhancements

### SSH Support

Secure connections can now be established using E-Term32 SSH 1.5 or 2.0. We ported the OpenSSH UNIX libraries to Windows producing a clean, robust, and intuitive user interface that is more powerful and easier to use than other SSH client software.

Port forwarding is also supported. This feature allows FTP sessions or even third-party X-window sessions to use E-Term32's secure connection to the host without fear of session hijacking. Some government regulations, such as HIPAA for the

medical industry, are now requiring secure connections to host applications that store and transmit patient data.

### New TrueType Display Font

In addition to our bitmap fonts we now include a custom-designed TrueType font that is highly scalable to support large monitors. The new font is also used for printing ensuring greater consistency between display and printed reports. Customized for terminal emulation requirements, the new font displays visually appealing line drawing characters for the accurate representation of host application boxes, windows and outlines.

### Startup.Ini Editor

This new utility makes the process of editing the main E-Term32 initialization file simpler and easier to understand. Each configuration setting is explained and online help is also included. This is a nice enhancement that eliminates the need for text editing of the Startup.ini file.

### Controller Mode Printing using Windows Print Drivers

This feature, along with the capability to define the number of lines and rows in a print job, allows more format control when printing through Controller Mode. Using the Windows print drivers in Controller Mode printing now supports printing to Postscript printers.

### Updated WS\_FTP ® Pro Release

One of the world's top FTP clients continues to get better and better. The 7.6 release adds support for SFTP over SSH 2.0 ensuring the confidentiality of sensitive business data. With accelerated download features, faster uploads, increased reliability, a new wizard, and better management capabilities, WS\_FTP Pro is an incredibly useful add-on to E-Term32.

### General Enhancements

As with any new release we fixed and tweaked various emulation, display, file transfer, and scripting problems reported by our customers, resulting in a more robust, accurate and stable product offering.

## Product Pricing and Order Form

Product	License	Price	Quantity	Total
E-Term32	Upgrade - Single	\$59.00		
E-Term32	Upgrade - 5-Pack	\$195.00
